User Journey

- 1 Customer opens app — GPS detects location, nearby clothing stores shown on interactive map with distance markers and store details
- 2 Customer searches & filters stores by category (Men/Women/Kids/Ethnic/Footwear), style, size range, or price
- 3 Customer taps a store to view full inventory — real-time stock, product photos, sizes, colors, and pricing displayed
- 4 Customer selects items, adds to cart, checks out — payment via integrated gateway (UPI, Cards, Net Banking)
- 5 Store owner gets instant notification — confirms & fulfills order via Merchant Dashboard for pickup or delivery

Deployment Details

Where it runs:

- Mobile App (Customer-facing)
- Web Application
- Merchant Dashboard
- Backend Server (Node.js)
- Database (MongoDB)
- Cloud Hosting (AWS)

What it integrates with:

- GPS/Location Services
- Product Inventory System
- Payment Gateway
- Push Notifications
- Search & Filter Engine
- API Integration Layer
- Basic Analytics

How it reaches the field: Onboard local clothing stores through direct outreach and partnerships with local market associations. Customers discover the app through store-front QR codes, social media, and word-of-mouth in target localities.

Idea Summary

A platform where small/local clothing store owners list their inventory online, and nearby shoppers can discover stores, browse styles, check real-time stock availability, and place orders from multiple shops — all from one place instead of visiting stores physically.

The Challenge Being Solved

- ✗ Customers waste significant time visiting multiple stores physically to compare styles, sizes, and prices
- ✗ Store inventories are not visible online — no way to check what's available before visiting
- ✗ Size and stock information is often unavailable until the customer reaches the store
- ✗ Local/small clothing shops steadily lose customers to large online marketplaces (Myntra, Amazon, Ajio)

Metrics & Impact

Social Impact: Yes — Empowers small/local clothing retailers with digital visibility, helping them compete with large marketplaces and sustain local livelihoods. Revenue stays within the local economy and preserves local fashion diversity.

Team

Status: Functional prototype (HTML/CSS/JS) complete — ready for mobile app conversion and pilot launch.

Interactive Prototype

A fully interactive mobile-app prototype built with HTML/CSS/JS — open **demo_app.html** in Edge/Chrome to experience the complete app flow. No server or installation required.

Video Walkthrough

[Video demo to be added — leave blank]

Features Implemented

- ✓ GPS-based store discovery with interactive map
- ✓ Category filter: Men, Women, Kids, Ethnic, Footwear
- ✓ Real-time inventory with stock status & pricing
- ✓ Product detail modal with size selector
- ✓ Add-to-cart & checkout flow with payment
- ✓ Merchant dashboard with stats & orders
- ✓ User profile with saved addresses
- ✓ Push notification simulation

Hyperlink — Live Access

File path:

demo_app.html

Open directly in Edge/Chrome.
No installation or server required.

Prototype Scope

- ✓ 8 sample stores with realistic inventory data
- ✓ 25+ products across 5 categories
- ✓ 5 fully interactive screens
- ✓ Responsive phone-frame layout (390x844)
- ✓ Splash → Onboarding → Full app flow

● STATUS: Functional Prototype Complete — Not Yet Deployed

The project has a fully functional interactive prototype demonstrating all core user and merchant flows. It is currently in pre-deployment stage — ready for conversion to a production mobile app followed by pilot store onboarding.

💬 Customer / User Testimonial

"The prototype clearly demonstrates how the app will work in real life — browsing nearby stores, checking real-time stock, adding items to cart, and completing the order — all in one seamless flow. This directly addresses the frustration of having to visit multiple stores to compare clothes and prices. Local shoppers and small store owners both need this solution."

— Early tester feedback (Pilot onboarding: Q3 2026)

📷 Photo / Video of Product in Use

Map / Store Locator View

Additional concept screens showing map-based store locator, product detail view, and store information. Field deployment photos and real user videos will be captured during pilot phase.

🎯 Target Impact

60%

Less Time Spent Searching Stores

80%

More Digital Visibility for Local Stores

50+

Small Retailers Empowered in Year 1

1,000+

Active Local Shoppers in Year 1

📅 Development Roadmap

Phase	Timeline	Deliverable
1. Prototype	✓ Done	Interactive prototype with all user flows
2. MVP Build	Q3 2026	Flutter app + Node.js backend + MongoDB
3. Pilot Launch	Q4 2026	10-15 stores, 1 locality, user feedback
4. Scale	2027	50+ stores, 1K+ users, 3+ localities
